                                                                                                                                                                                                                                                                                                                                                                                                                      antibody and as a
                                                                                                                                                                                This sequence represents a complementarity determining region (CDR) from the heavy chain of the antibody of the invention. The antibody of the invention is a human CDR transplanted antibody, that reacts specifically with ganglioside GM2. DNA encoding the antibody, and vectors and transformants containing it, can be used for the recombinant production of the antibody. The antibody itself can be used as an anti-tumour agent or as a diagnostic tool for related cancers. The antibody has antitumour activity against ganglioside GM2 positive cells.
                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                    A human type complementarity determining region transplanted antibody against ganglioside GM2 - useful as an anti-tumour and as a diagnostic for related cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 1998-575904/49

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cc domain-containing receptor (KDR) with a comparable affinity to human CC vascular endothelial growth factor (VEGF). The antibodies neutralise KDR activation. The immunoglobulin may be a multivalent single CC chain antibody, a monovalent single chain antibody, a diabody, a CC triabody, a humanised antibody or a chimerised antibody, a CC triabody, a monovalent single chain antibody, a CC The immunoglobulin molecules bind specifically to an CC vertracellular domain of the KDR receptor with the same affinity as CC VEGF. Overexpression of VEGF has been implicated in a number of the mangioblastoma, central nervous system meoplasms and AIDS associated Karposi's sarcoma. The antibodies therefore have applications in treating these conditions. This sequence encodes a CC immunoglobulins of the invention.

CC immunoglobulins of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC fragments or derivatives) or aptamers (collectively (I)) and detecting (formation of a complex (C) between (I) and the corresponding antigen of (A). The first and second (I) bind to epitopes of different antigens of (Ag). These epitopes are present, after passage through the intestines, (C) in at least some mammals, and have either: (i) their native structure; (C) or (ii) a structure against which an antibody is produced by an animal confected or immunized with (A), or its extract, lysate, derived protein or fragment, or with a synthetic peptide. Practically all mammals display at least one of the specified epitopes. The method is used to detect (infection by acid-fast bacteria, particularly of the genera Helicobacter, Mycobacterium and Campylobacter, specifically H. pylori, H. hepaticus, (C) Mycobacterium and Campylobacter, specifically H. pylori, H. hepaticus, (C) Mycobacterium and campylobacter and non-invasive, and provides an inexpensive and easily standardizable diagnosis, despite possible degradation of antigens during passage through the intestines. This sequence represents a fragment of a H. pylori 26 kDa protein-binding cused to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  involves treating the mammals with humanised VEGFR monoclonal antibodies (antagonists). Humanised monoclonal antibody comprises humanised mouse variable region joined to human constant region, where the humanised mouse variable region contains mouse complementarity determining region (CDR) grafted into human variable region. The method is useful for treating leukaemias such as acute or chronic myelocytic leukaemia, acute or chronic lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to non-Hodgkin's and Hodgkin's disease. The present sequence is humanised antibody murine light chain hypervariable region (VI) CDR-2 used in the
02-AUG-2001.

The anti-angiogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially IMC-1C11. Conditions that can be treated include a neoplasm, a collagen-vascular disease or an autoimmune disease, especially a solid tumour, including breast carcinoma, lung carcinoma, prostate carcinoma, colon carcinoma, prostate carcinoma, ovarian carcinoma, neuroblastoma, colon carcinoma (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2 of the light chain variable region (see also AAB82702) of IMC-1C11, a mouse human chimeric antibody that has vascular endothelial growth factor (VEGF) antagonist activity. The antipode transport of it, can be used as an anti-angiogenic molecular together with a chemotherapeutic acid, for the treatment of an angiogenic dependent condition in a mammal, especially a human The invention relates generally to a method of treating or controlling an angiogenic dependent condition by administering anti-angiogenic molecule and a chemotherapeutic agent, to produce the second of treating or controlling an angiogenic dependent condition by administering anti-angiogenic molecule and a chemotherapeutic agent, to produce the second of the second of treating or controlling an angiogenic dependent condition by administering anti-angiogenic molecule and a chemotherapeutic agent, to produce the second of the second o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an antibody, which can react specifically with ganglioside GD2, and is transplanted with a human type complementation-determining domain (CDR), or its fragments. The antibody and its derivatives are useful in diagnosis and therapy of tumours, particularly cancer diagnosis. The present sequence is a peptide used in the exemplification of the invention.
                      The present invention relates to derivatives of an antibody against ganglioside GM2. The antibody may be a monoclonal antibody or its fragments. The antibody is combined with a radioactive isotope, protein or small drug in the treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human type complementation-determining domain transplanted antibody and derivatives against ganglioside GD2, useful in diagnosis and therapy of e.g. tumours, has low antigenicity, little side effects but potent

                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                         to kinase insert domain-containing receptor (KDR) (a human homologue of mouse foetal liver kinase (FLR)-1 receptor) with an affinity comparable to human vascular endothelial growth factor (VEGP) and that neutralises activation of KDR. Sequences of the invention are useful for neutralising the activation of KDR, for reducing tumour growth and for inhibiting angiogenesis. The present sequence is mouse anti-KDR plCl1 scFv antibody light chain complementarity determining region 2 (CDRL2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel immunoglobulin molecule for reducing tumor growth, binds to kinase insert domain-containing receptor with an affinity comparable human vascular endothelial growth factor, and neutralizes activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Zhu

                                                                                                                                                                                                                                                                                                                                                                                                      Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC complex of two polypeptides (PI) and two second polypeptides (P2) which CC are stably associated in an immunoglobulin like complex. PI has an CC antigen-binding site located to the N terminus of immunoglobulin (Ig) CC light chain constant domain (CL domain), and P2 has an antigen-binding CC site located to the N terminus of the CH1 domain. (I) is useful for: CC neutralising the activation of a vascular endothelial growth factor CC (VEGF) receptor, reducing tumour growth; inhibiting angiogenesis; CC reducing endothelial cell proliferation; inhibiting VEGF induced CC migration of human leukaemia cells; blocking interaction of a protein and CC its ligand; promoting interactions between immune cells and target cells; cand in vivo and in vitro for investigative, diagnostic or treatment CC methods. The design of (I) provides for efficient production so that compating and configuration. (I) is bivalent and bispecific, homogeneous in the desired configuration. (I) is bivalent and bispecific, homogeneous CC and in tetrameric form. The heavy chain constant domains which constitute the FC region (e.g., CH2 and CH3 for an IGG molecule) of a natural CC antibody and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. CC in peptide sequence represents the light chain variable domain contains which contains complete product. The period complementarity determining region L2 (CDRL2) incorporated into an CC antigen-binding protein described in the method of the invention.

The bispecific antigen-binding proteins block activation of the VEGF receptor and are useful for reducing or inhibiting VEGF-induced cellular functions such as mitogenesis of vascular endothelial cells and migration of leukaemia cells. The antibodies are useful for treating tumours and for in vivo or in vitro for investigative and diagnostic methods. This sequence represents a mouse peptide relating to the bispecific antibodies that bind to the VEGF receptors of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New bispecific antibodies having antigen-binding sites specific for first vascular endothelial growth factor (VEGF) receptor and for a second VEGF receptor, useful for inhibiting migration of leukemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Zhu

                                                                                                                                                                                                                                                       This invention describes novel heavy chain and light chain polypeptides or their fragments of a recombinant antibody to human TNF-alpha which contain complementarity determining region (CDR) sequences. The products of the invention have vasotropic, antiarthritic, neuroprotective and protozoacide activity. The antibodies act by neutralising TNF-alpha in vivo. The antibodies are used for producing chimeric and humanised antibodies that may be used for the treatment and prevention of TNF-alpha ancisociated diseases such as toxic shock syndrome, rheumatoid arthritis, malaria and multiple sclerosis. The antibodies have low immunogenicity in humans. This sequence represents the anti-human tumour necrosis factor-alpha (TNF-alpha) light chain CDR1 designated CDR-I2.
                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 3b; Page 26; 36pp; Japanese.

-I- FUNCTION: Key transcription factor for sexual development. Activates the transcription of stell. Binds to a stress relement-like (SRE) region in the stell promoter.

-I- SUBCELLULAR LOCATION: Nuclear (Probable).

codon suppression.";
Development 124:1405-1417(1997). Robinson D.N., Cooley L.; "Examination of two kelch proteins generated by stop

- FUNCTION: FUNCTION: COMPONENT OF RING CANALS THAT REGULATES THE FLOW OF CYTOPLASM BETWEEN CELLS. MAY BE INVOLVED IN THE REGULATION OF CYTOPLASM FLOW FROM NURSE CELLS TO THE OOCYTE DURING OOGENESIS
- BINDS ACTIN.
 SUBCELLULAR LOCATION:
 CANALS PRESENT IN EGG INNER SURFACE OF CYTOPLASMIC BRIDGES OR CHAMBERS. SUBCORTICALLY IN IMAGINAL DISK DISK RING
- PPITHELIA.

 -! TISSUE SPECIFICITY: BOTH PROTEINS ARE EXPRESSED IN OVARIES, MITSUE SPECIFICITY: BOTH PROTEINS ARE EXPRESSED IN OVARIES, MITSUES, CUTICLE, SALIVARY GLAND AND INFESTIS, OVARECTOMIZED FEMALES, CUTICLE, SALIVARY GLAND AND INAGINAL DISKS. KELCH ORF1 IS THE PREDOMINANT PROTEIN AND IS EXPRESSED IN FAT BODIES. ON ENTRY INTO METAMORPHOSIS LEVELS COULT LENGTH PROTEIN INCREASE IN TESTIS AND IMAGINAL DISKS.

 -!- DEVELOPMENTAL STAGE: LARVAE, PUPAE AND ADULTS.

 -!- SIMILARITY: Contains 1 BTB/POZ domain.

 -!- SIMILARITY: Contains 6 Kelch repeats.

 -!- SIMILARITY: Contains 6 Kelch repeats.

 -!- CAUTION: Ref. 2 sequence differs from that shown due to errong the second of the second MALE
- erroneous

gene model prediction.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                             Score
